## Measure internal temperature sensor

---

Example Code Introduction for 32-bit NuMicro<sup>®</sup> Family

---

### Information

Application	ADC measure internal temperature sensor example code of microcontrollers
BSP Version	M051 Series BSP CMSIS v3.01.001
Hardware	NuTiny-EVB-M051_V3.0

## 1 Function Description

### 1.1 Introduction

Microcontrollers are widely used in different ambient temperatures. Nuvoton NuMicro® Cortex®-M0 M051 Series built-in a temperature sensor. This example shows how to use the ADC to get the Celsius temperature of the temperature sensor.

### 1.2 Principle

The ADC uses the reference voltage as a reference base. Equally distributed the reference voltage to a few steps. The step is related to the resolution of the ADC. Before measuring the temperature sensor voltage, the reference voltage must be known before the value of the measured temperature sensor can be converted into a voltage.

$$\text{Bandgap Voltage} = \frac{\text{ADC Reference Voltage}}{\text{ADC Bandgap data}}$$

Equation 1-1 Band-gap voltage and reference voltage relationship

The M051 ADC measures the Band-gap voltage. The Band-gap voltage is a fixed voltage. The Band-gap voltage of the M051 is 1.2V. The ADC reference voltage can be calculated by Equation 1-1.

$$\text{Conversion Data} = \frac{\text{Temperature Voltage} \times 4096 \text{ (12 Bits Resoulution)}}{\text{ADC Reference Voltage}}$$

Equation 1-2 Temperature sensor voltage calculation formula

After the ADC measures the temperature sensor value, the voltage of the temperature sensor can be calculated by referring to Equation 1-2.

$$\text{Temperature Celsius} = \frac{(\text{Temperature Voltage} \times 1000) - \text{Sensor Offset}}{\text{Gain}}$$

Equation 1-3 Temperature sensor voltage temperature conversion formula

The built-in temperature sensor of M051 is a negative temperature coefficient sensor. Refer to Figure 1-1. The lower the temperature, the higher the voltage. Gain is the negative temperature coefficient and Offset is the compensation value adjustment. The temperature of the temperature sensor can be converted to Celsius by Equation 1-3. Please refer to the relevant documents of M051 for the actual temperature sensor parameters and Band-gap

voltage specifications.

Figure 1-1 Temperature sensor voltage temperature diagram

## 1.3 Demo Result

```
UART #1
System clock rate: 50000000 Hz
-----+-----
|           ADC for temperature sensor example code           |
+-----+-----

In this example, software will get value from temperature sensor.
Conversion result of channel 7: 0x38F (29.53 °C)
Conversion result of channel 7: 0x38D (30.61 °C)
Conversion result of channel 7: 0x38F (29.29 °C)
Conversion result of channel 7: 0x38D (30.14 °C)
Conversion result of channel 7: 0x38C (30.79 °C)
Conversion result of channel 7: 0x38C (30.32 °C)
Conversion result of channel 7: 0x38D (30.14 °C)
Conversion result of channel 7: 0x38D (30.14 °C)
Conversion result of channel 7: 0x38C (30.32 °C)
Conversion result of channel 7: 0x38D (30.37 °C)
Conversion result of channel 7: 0x38D (30.14 °C)
Conversion result of channel 7: 0x38E (29.71 °C)
Conversion result of channel 7: 0x38C (30.79 °C)
```

## 2 Code Description

Enable temperature sensor

```
/* Enable Temperature Sensor function */
SYS->TEMPCR |= SYS_TEMPCR_VTEMP_EN_Msk;
```

As shown in Figure 2-1, ADC channel 7 can select three measurement sources. The following codes are set for ADC channel 7 source as Band-Gap (VBG) and ADC channel 7 source is set to built-in temperature sensor (VTEMP):

Figure 2-1 Source of ADC Channel 7

```
/* Configure the analog input source of channel 7 */
ADC_CONFIG_CH7(ADC, ADC_ADCHER_PRESEL_INT_BANDGAP);
/* Configure the analog input source of channel 7 */
ADC_CONFIG_CH7(ADC, ADC_ADCHER_PRESEL_INT_TEMPERATURE_SENSOR);
```

Get the ADC measurement Band-gap conversion value, guess the ADC external reference voltage.

```
/* Calculate dVref by using conversion result of VBG */
/* ConversionData = VBG * 4096 / Vref */
i32ConversionData = ADC_GET_CONVERSION_DATA(ADC, 7);
dVref = VBG * 4096 / (double)i32ConversionData;
```

Get the conversion value of the ADC measurement temperature and calculate the Celsius temperature.

```
/* Calculate value from temperature sensor */
/* ConversionData = Vtemp(V) * 4096 / dVref */
/* Vtemp(mV) = Gain * Temperature + Offset */
i32ConversionData = ADC_GET_CONVERSION_DATA(ADC, 7);
dTempData = (((double)i32ConversionData * dVref / 4096) * 1000 - Offset) / Gain;
```

## Software and Hardware Environment

- **Software Environment**

- BSP version
  - ◆ M051 Series BSP CMSIS v3.01.001
- IDE version
  - ◆ Keil uVersion 5.24

- **Hardware Environment**

- Circuit components
  - ◆ NuTiny-EVB-M051\_V3.0

## 4 How to Execute Example Code

1. Browsing into sample code folder by **Error! Reference source not found.** (section 4) and double click Measure\_Internal\_Temperature\_Sensor.uvproj.
2. Enter Keil compile mode
  - a. Build
  - b. Download
  - c. Start/Stop debug session
3. Enter debug mode
  - a. Run

## 5 Revision History

Date	Revision	Description
Jun. 30, 2019	1.00	1. Initially issued.

### Important Notice

Nuvoton Products are neither intended nor warranted for usage in systems or equipment, any malfunction or failure of which may cause loss of human life, bodily injury or severe property damage. Such applications are deemed, "Insecure Usage".

Insecure usage includes, but is not limited to: equipment for surgical implementation, atomic energy control instruments, airplane or spaceship instruments, the control or operation of dynamic, brake or safety systems designed for vehicular use, traffic signal instruments, all types of safety devices, and other applications intended to support or sustain life.

All Insecure Usage shall be made at customer's risk, and in the event that third parties lay claims to Nuvoton as a result of customer's Insecure Usage, customer shall indemnify the damages and liabilities thus incurred by Nuvoton.
