■ IMPORTANT NOTICE

Regarding the specifications of this product, it is considered that you have agreed to the quality level and disclaimer described below.

Support for industry standards and quality standards

Functional safety standards for automobiles ISO26262	**No**
AEC-Q100	**Yes**
Market failure rate	**50Fit**

Disclaimer

1. When the application system is designed using this IC, please design the system at your own risk. Please read, consider, and apply appropriate usage notes and description in this standard.

2. When designing your application system, please take into the consideration of break down and failure mode occurrence and possibility in semiconductor products. Measures on the systems such as, but not limited to, redundant design, mitigating the spread of fire, or preventing glitch, are recommended in order to prevent physical injury, fire, social damages, etc. in using the Nuvoton Technology Japan Corporation (hereinafter referred to as NTCJ) products.

3. When using this IC, for each actual application systems, verify the systems and the all functionality of this IC as intended in application systems and the safety including the long-term reliability at your own risk

4. Please use this IC in compliance with all applicable laws, regulations and safety-related requirements that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. NTCJ shall not be held responsible for any damage incurred as a result of this IC being used not in compliance with the applicable laws, regulations and safety-related requirements.

5. This IC does not have any security functions using cryptographic algorithms, such as authentication, encryption, tampering detection.

6. Unless this IC is indicated by NTCJ to be used in applications as meeting the requirements of a particular industry standard (e.g., ISO 9001, IATF 16949, ISO 26262, etc.), this IC is neither designed nor intended for use in such environments for that applications. NTCJ shall not be held responsible for not meeting the requirements of a particular industry standard.

7. Using IC that have been indicated as compliant with industry functional safety standards does not warrant that the application meets the requirements of industry functional safety standards. NTCJ shall not be held responsible for the application compliance with requirements of the particular industry functional safety standard.

8. Unless this IC is indicated by NTCJ to be used in applications as meeting the requirements of a particular quality standard (e.g., AEC-Q100, etc.), this IC is neither designed nor intended for use in such the environments for that applications. NTCJ shall not be held responsible for not meeting the requirements of a particular quality standard.

9. In case of damages, costs, losses, and/or liabilities incurred by NTCJ arising from customer's non-compliance with above from 1 to 8, customer will indemnify NTCJ against every damages, costs, losses and responsibility.

FEATURES

- Supply voltage range: 4.5 V ~ 26.4 V
- Built-in 5-V regulator
- 3-phase full-wave sine-wave PWM drive by 1-Hall-sensor
- Selectable Input Mode: Either linear voltage input or PWM input through VSP pin
- Selectable the start frequency through SWSF pin
- Conduction angle auto driver phase shift correction
- Rotation direction selectable (Forward/Reverse)
- FG pulse divide selectable
- Sleep mode
- Various protection functions:
  Under Voltage Lock Out (UVLO), Over Voltage Lock Out (OVLO), Thermal protection, Over Load Protection, and Over Current Protection
- Package
  QFN 24L (4x4x0.8mm3, Lead Pitch 0.5mm)

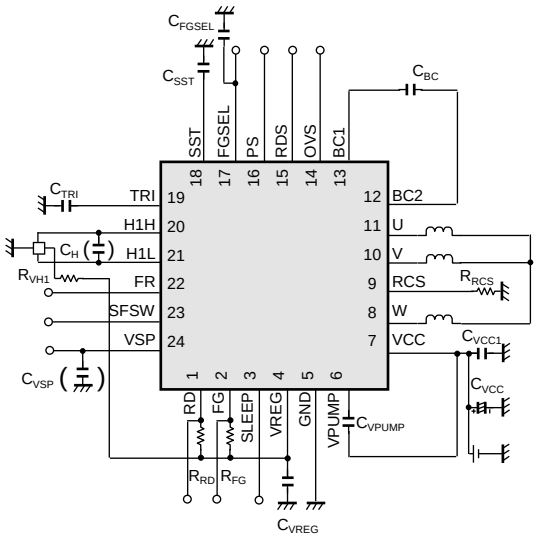
DESCRIPTION

- KA44143A is a driver IC for 3-phase brushless motor optimized for fan motors.
  By employing the rotor position detector and sine wave PWM drive by 1-Hall-sensor, this IC achieves component reduction and miniaturization of motor set as well as motor drive at low noise, low vibration and low power consumption.

APPLICATIONS

- Refrigerator, Projector, Printer, Factory automation, Automotive fan for HVAC

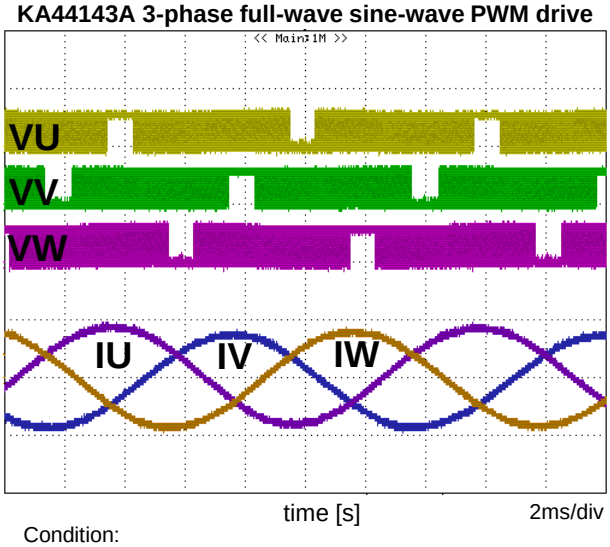
TYPICAL APPLICATION



Notes: The application circuit is an example. The operation of the mass production set is not guaranteed. Sufficient evaluation and verification is required in the design of the mass production set. The Customer is fully responsible for the incorporation of the above illustrated application circuit in the design of the equipment.

Motor drive waveform

KA44143A 3-phase full-wave sine-wave PWM drive



Condition:
V_{CC} = 12 V, V_{FR} = 0 V, V_{VSP} = PWM mode (60kHz,Duty60%)

CONTENTS

ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Rating	Unit	Notes
Supply voltage	V_{CC}	28	V	*1
Operating ambient temperature	T_{opr}	– 40 ～ + 105	°C	*2
Storage temperature	T_{stg}	– 55 ～ +150	°C	*2
Input Voltage Range	V_{VREG}	– 0.3 ～ 6.0	V	*3
	V_{SLEEP},V_{H1H},V_{H1L},V_{FGSEL}, V_{VSP},V_{SFSW},V_{FR},V_{RDS},V_{PS},V_{OVS}	– 0.3 ～ 6.0	V	—
	V_{TRI} ,V_{SST}	– 0.3 ～ 6.0	V	—
Output Voltage Range	V_{FG},V_{RD}	– 0.3 ～ 6.0	V	—
	V_{VREG}	– 0.3 ～ 6.0	V	—
	V_{RCS}	– 0.3 ～ 6.0	V	*4
	V_{BC1}	28	V	*4
	V_{BC2},V_{pump}	37	V	*4
Output Current Range	I_{Upeak}, I_{Vpeak}, I_{Wpeak}	± 2200	mA	*5, *6
	I_{FG},I_{RD}	5	mA	—
	I_{VREG}	−10	mA	—
ESD	HBM	2	kV	—

Notes: This product may sustain permanent damage if subjected to conditions higher than the above stated absolute maximum rating. This rating is the maximum rating and device operating at this range is not guaranteed as it is higher than our stated recommended operating range. When subjected under the absolute maximum rating for a long time, the reliability of the product may be affected.

*1:The values under the condition not exceeding the above absolute maximum ratings and the power dissipation.

*2: Except for the power dissipation, operating ambient temperature, and storage temperature, all ratings are for Ta = 25℃.

*3: Applying external voltage to this pin is possible only when this pin and VCC pin is connected.
When applying external voltage to this pin, do not exceed the stated ratings even in transient state.

*4: Applying external voltage into these pins is prohibited. Do not exceed the stated ratings even in transient state.

*5: Applying external voltage into these pins is prohibited. Do not exceed the stated ratings even in transient state.

*6: For VCC≧5.6 V, output current is ±2200 mA. For VCC＜5.6 V, output current is ±1500 mA.
Please ensure that there is enough margin and the design does not exceed the allowable value of Power Dissipation(P_D) and Area of Safe Operation(ASO).

POWER DISSIPATION RATING

Package	θ_{j-a}	θ_{j-c}	P_D (T_a=25 °C)	P_D (T_a=105 °C)
QFN 24L (4x4x0.8mm3, Lead Pitch 0.5mm)	56.1 °C/W	4.4 °C/W	2.22 W	0.80 W

Notes: For the actual usage, follow the power supply voltage, load and ambient temperature conditions to ensure that there is enough margin and the thermal design does not exceed the allowable value.

Glass-Epoxy Substrate (2 Layers) : 50 x 50 x 0.8t (mm), Heat dissipation fin: Die-pad, Soldered.

(Heat dissipation via 2 layer board)

CAUTION

Although this IC has built-in ESD protection circuit, it may still sustain permanent damage if not handled properly. Therefore, proper ESD precautions are recommended to avoid electrostatic damage to the MOS gates.

RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Min.	Typ.	Max.	Unit	Notes
Supply voltage range	V_{CC}	4.5	—	26.4	V	—
Input voltage range	V_{SLEEP}	0	—	V_{VREG}	V	*1
	V_{H1H}	0	—	V_{VREG}	V	*1
	V_{H1L}	0	—	V_{VREG}	V	*1
	V_{PS}	0	—	V_{VREG}	V	*1
	V_{RDS}	0	—	V_{VREG}	V	*1
	V_{OVS}	0	—	V_{VREG}	V	*1
	V_{FGSEL}	0	—	V_{VREG}	V	*1
	V_{VSP}	0	—	V_{VREG}	V	*1
	V_{SFSW}	0	—	V_{VREG}	V	*1
	V_{FR}	0	—	V_{VREG}	V	*1
External constants	C_{VCC}	4.7µ	—	—	F	*2,*3
	C_{VCC1}	—	0.1µ	—	F	*2,*3
	C_{VREG}	—	0.1µ	—	F	*2,*4
	C_{SST}	22p	1800p	—	F	*2,*5
	C_{BC}	—	0.1µ	—	F	*2,*4
	C_{VPUMP}	—	0.1µ	—	F	*2,*4
	C_{TRI}	220p	390p	1300p	F	*2,*5
	R_{RCS}	0.15	0.22	—	Ω	*2,*5,*6
	R_{VH}	—	1k	—	Ω	*2,*5
	C_{FGSEL}	—	0.01µ	—	F	*2,*7
	C_{VSP}	—	0.1µ	—	F	*2,*8

Note: *1: For setting range of input control voltage, refer to Electrical Characteristics (page 7 - 10) and Operation (page 13 - 35).
*2: Operation of mass production set is not guaranteed. Perform enough evaluation and verification on the design of mass production set.
*3: Please perform sufficient evaluation and verification to ensure that VCC pin voltage ripple is reduced.
*4: It is recommended to use the values indicated.
*5: Please choose the setting according to the usage. Please refer to the Electrical Characteristics (page 7 - 10) and Operation (page 13 - 35).
*6: Do not use resistor of value smaller than this. When using value smaller than the minimum value, latch-up function which is used to prevent thermal damage may operate due to external factors (PCB heat dissipation, metal impedance, etc...) or internal factors (threshold change, etc...).
*7: When using with FGSEL pin open, please connect capacitor to the FGSEL pin to prevent noise and carry out sufficient evaluation and verification.
*8: When VSP pin is used for DC input, it is recommended to insert a capacitor to the VSP pin.

ELECTRICAL CHARACTERISTICS

V_{CC} = 12.0 V, V_{VREG} = 5.0 V

Note: T_a = 25°C±2°C unless otherwise noted.

Parameter	Symbol	Condition	Limits			Unit	Note
			Min	Typ	Max

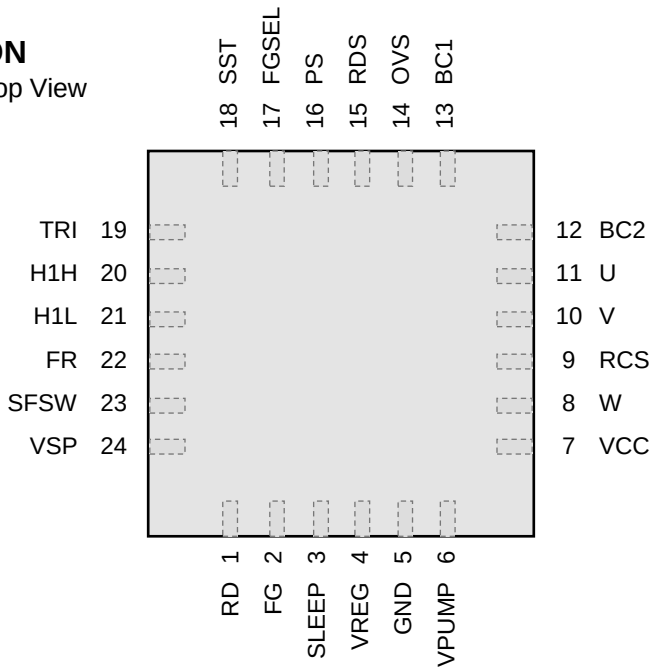
PIN CONFIGURATION

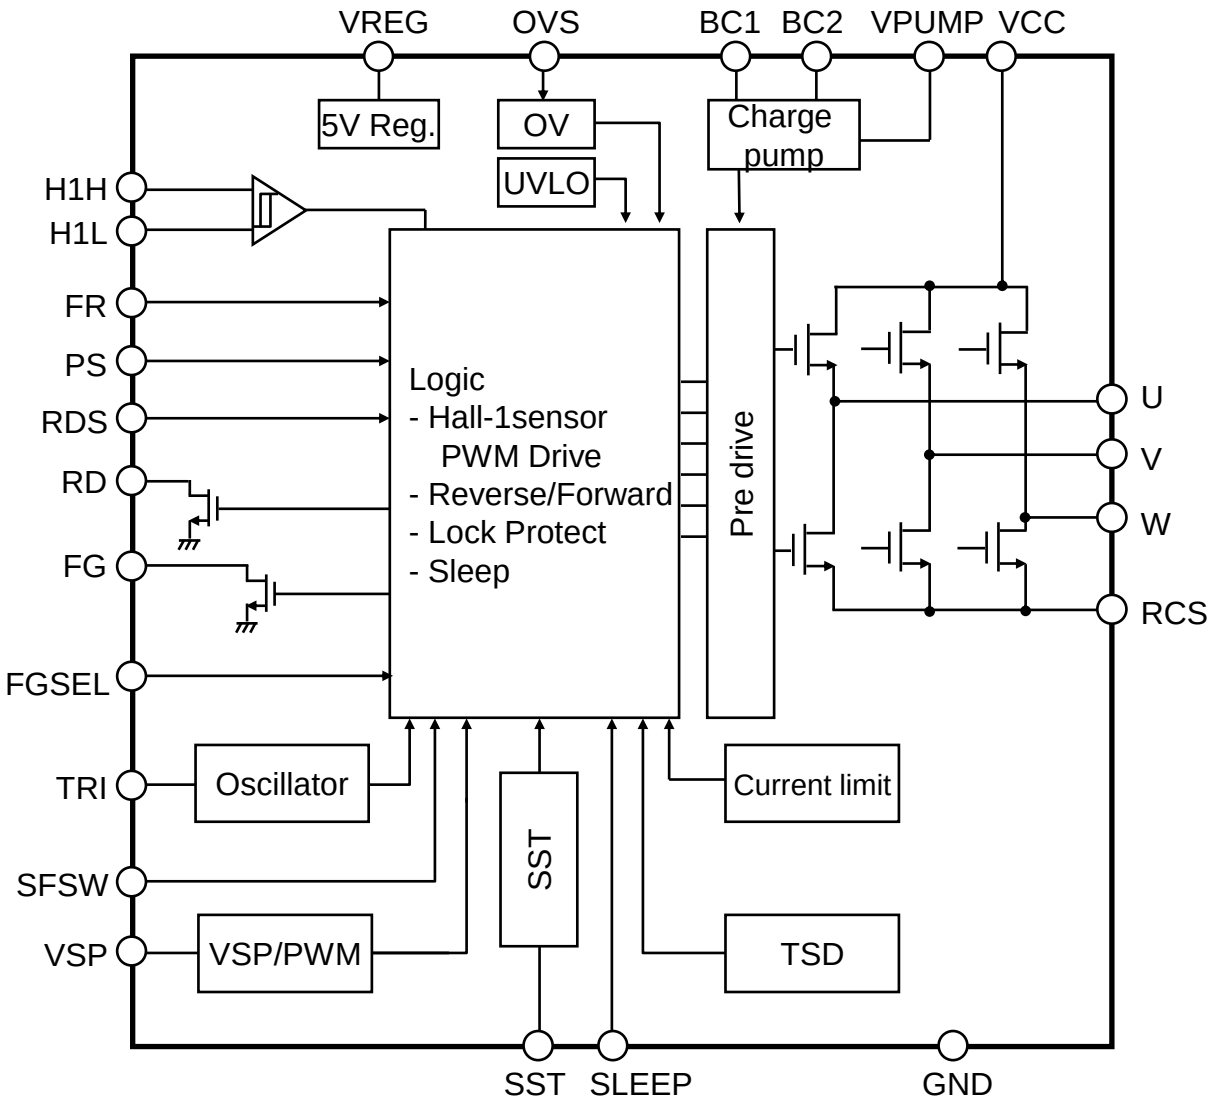
Top View



PIN FUNCTIONS

Pin No.	Pin name	Type	Description
1	RD	Output	Over load protection
2	FG	Output	FG external output
3	SLEEP	Input	Sleep setting
4	VREG	Output	Internal reference voltage
5	GND	Ground	Ground
6	VPUMP	Output	Charge pump circuit output
7	VCC	Power	Supply voltage for motor
8	W	Output	W-phase output
9	RCS	Output	Motor current detector
10	V	Output	V-phase output
11	U	Output	U-phase output
12	BC2	Output	Capacitor connection pin 2 for charge pump
13	BC1	Output	Capacitor connection pin 1 for charge pump
14	OVS	Input	Over voltage detection selectable threshold. High for 16V detection, Low for 27.2V detection
15	RDS	Input	Selectable Release of Motor lock protection. High to use the release of lock protection. Low to disable the release of lock protection.
16	PS	Input	Selectable phase shift mode. High to enable constant phase shift mode. Low to enable Auto Phase FB shift mode.
17	FGSEL	Input	FG pulse count select
18	SST	Input / Output	Capacitor connection pin for Soft Start triangle wave oscillator frequency setting
19	TRI	Input / Output	Capacitor connection pin for PWM triangle wave oscillator frequency setting
20	H1H	Input	Hall amplifier input (+)
21	H1L	Input	Hall amplifier input (-)
22	FR	Input	Rotation direction select (Forward/Reverse)
23	SFSW	Input	Selectable the start frequency
24	VSP	Input	Voltage input for setting rotating speed

FUNCTIONAL BLOCK DIAGRAM



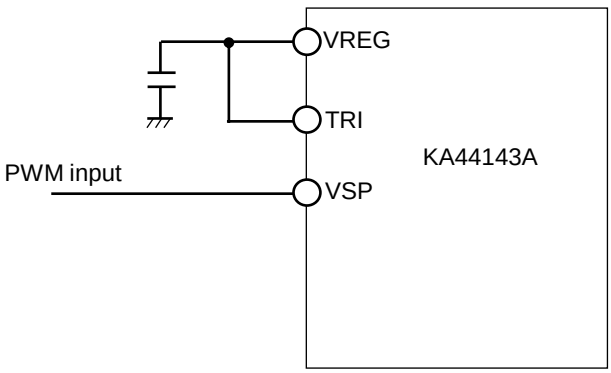
OPERATION

Note) The characteristics listed below are reference values derived from design of the IC and are not guaranteed.

1. VSP input configuration

1-1. PWM input mode

PWM input control or DC input control are used as the input controls to VSP pin.
When using PWM input control, please ensure to connect TRI pin to VREG pin.
Peak value of average output voltage is determined, corresponding to PWM duty signal.



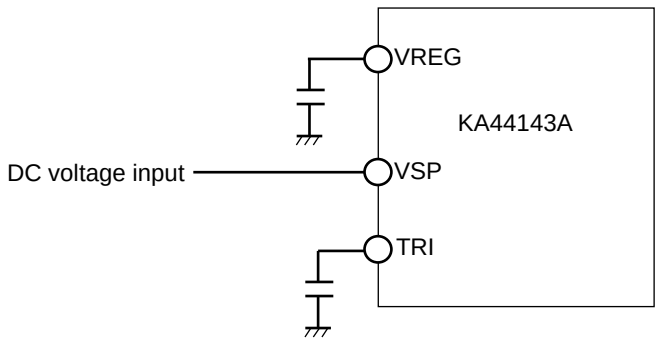
OPERATION (Continued)

Note) The characteristics listed below are reference values derived from design of the IC and are not guaranteed.

1. VSP input configuration (Continued)

1-2. VSP input mode

PWM input control or DC input control are used as the input controls to VSP pin.
When using DC input control, please ensure to connect a capacitor between TRI pin and GND pin.



Signal during DC input mode

During DC input mode, PWM signal is generated by the comparison between the TRI pin triangle waveform and the VSP pin input DC voltage.
Peak value of average output voltage is dependent on VSP pin voltage and output PWM frequency is dependent on TRI pin triangle waveform frequency.

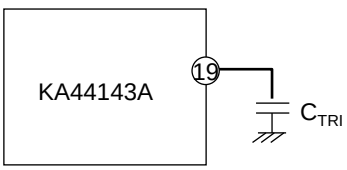
TRI pin triangle wave oscillator frequency

The triangle wave oscillator frequency input into TRI pin is calculated using the below formula.

Triangle wave oscillator frequency

$$f_{TRI} = \frac{I_{TRI}}{2 \times C_{TRI} \times V_{TRI}}$$

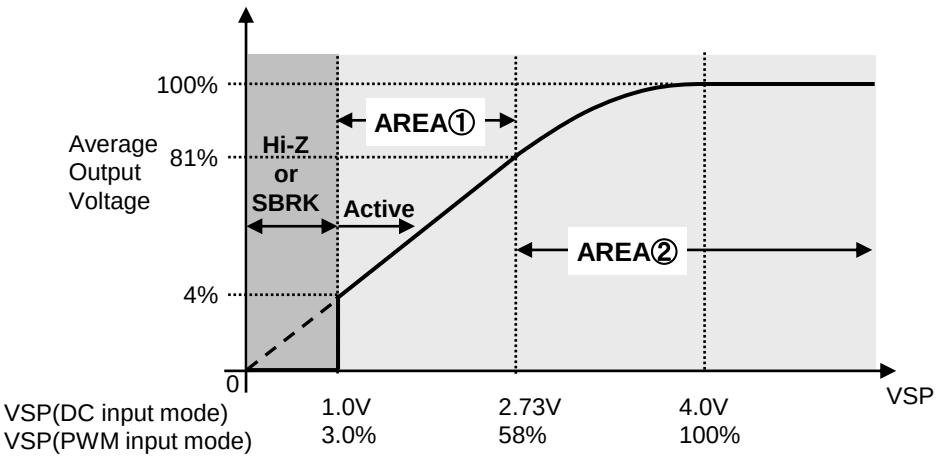
V_{TRI} : Triangle waveform amplitude (Under typ.1.53 V)
I_{TRI} : 64.5 μA (Under typ.)



OPERATION (Continued)

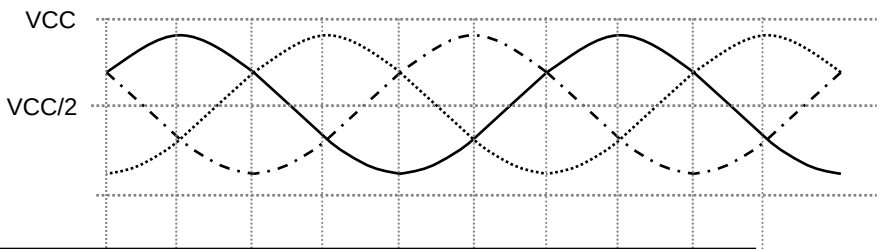
Note) The characteristics listed below are reference values derived from design of the IC and are not guaranteed.

2. VSP input voltage and average output voltage



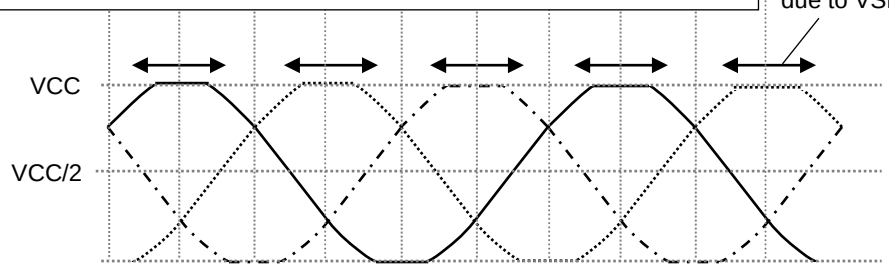
○Average Output Voltage of motor

AREA① Output Duty is linearly dependent on VSP input
・VSP(DC input mode) ≒ 1.0V ~ 2.73 V
・VSP(PWM input mode) = 3.0% ~ 58 %



AREA② Output Duty is non-lineary dependent on VSP as average voltage is distorted by VCC
・VSP(DC input mode) ≒ 2.73V ~ 4.0 V
・VSP(PWM input mode) = 58% ~ 100 %

Distorted area is increased due to VSP dependence



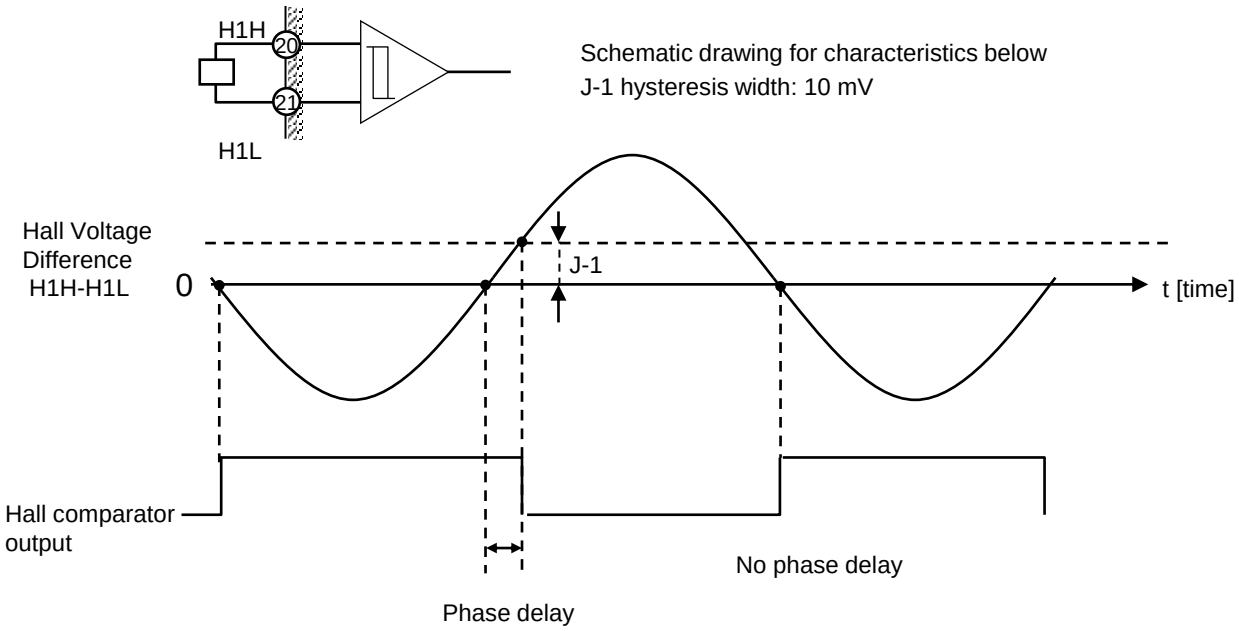
OPERATION (Continued)

Note) The characteristics listed below are reference values derived from design of the IC and are not guaranteed.

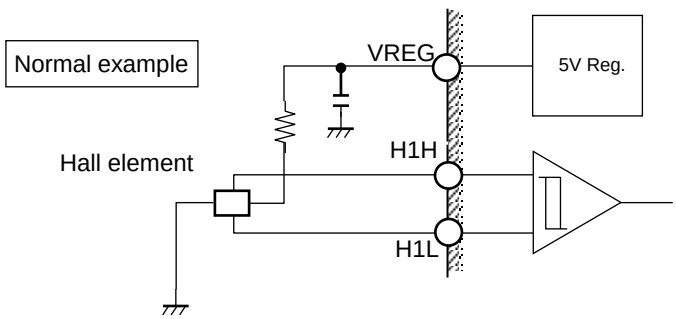
3. Hall Input Specification

3-1. System to detect hall signal

The motor position is detected by the Hall hysteresis comparator. If the amplitude of sine wave is small, phase delay of comparator output will be very prominent. Therefore, please make the amplitude of the sine wave larger. Recommendation is 200 mV or more. When chattering occurs to Hall element, insert a capacitor between H1H (pin 20) and H1L (pin 21).



For the biased source of the Hall element, please construct by externally shorting to VREG pin.



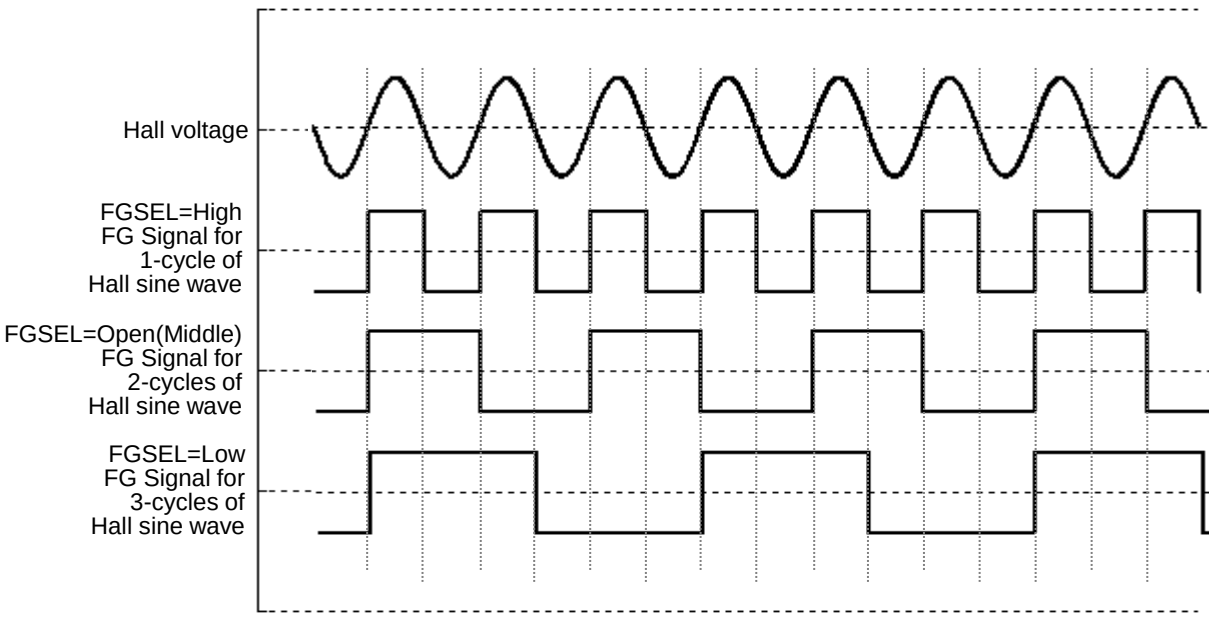
OPERATION (Continued)

Note) The characteristics listed below are reference values derived from design of the IC and are not guaranteed.

3. Hall Input Specification (Continued)

3-2. The Relation between Hall Voltage and FGSEL

1-cycle FG signal, which is equivalent to 1-cycle/2-cycle/3-cycle of Hall sine wave (selected by FGSEL), is output.



OPERATION (Continued)

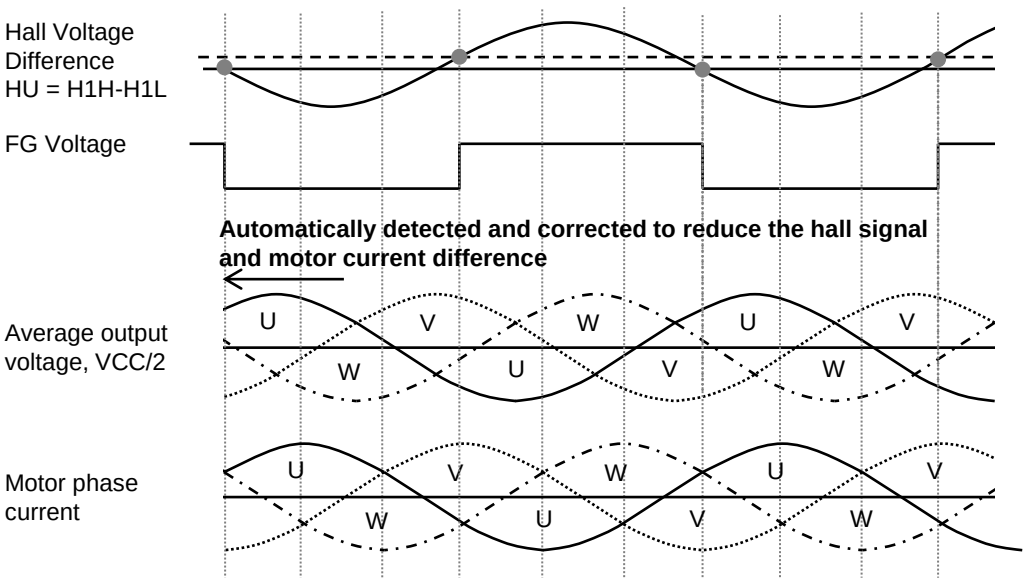
Note) The characteristics listed below are reference values derived from design of the IC and are not guaranteed.

3. Hall Input Specification (Continued)

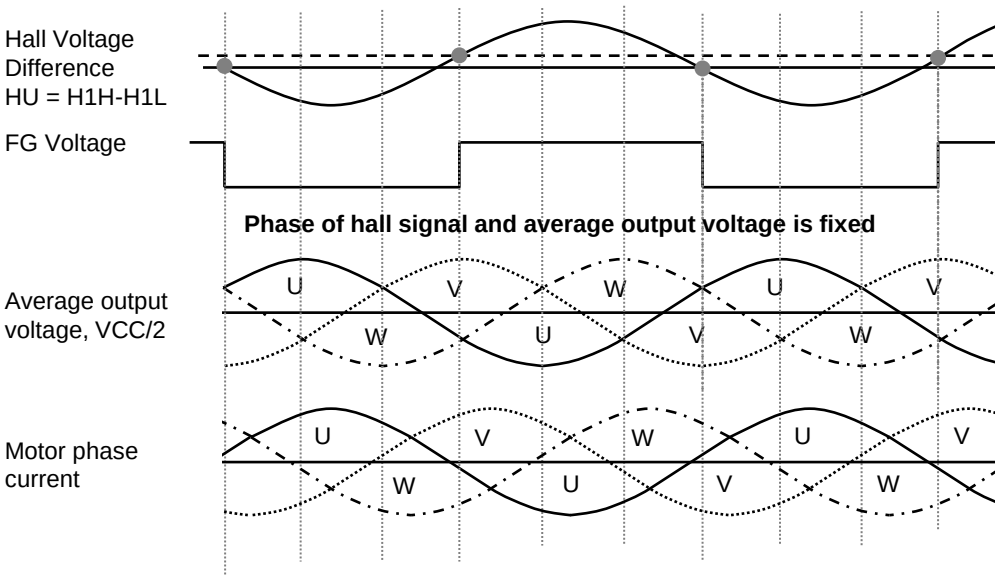
3-3. Drive Phase Shift Control

Automatic drive phase shift control when PS=Low. The hall signal phase with respect to the conduction angle detects the IC's own phase difference and automatically correct it to the most optimum phase. The example for U-phase output voltage is shown below.

Automatic drive phase shift control when PS=Low



Fixed to 0 deg when PS=High



OPERATION (Continued)

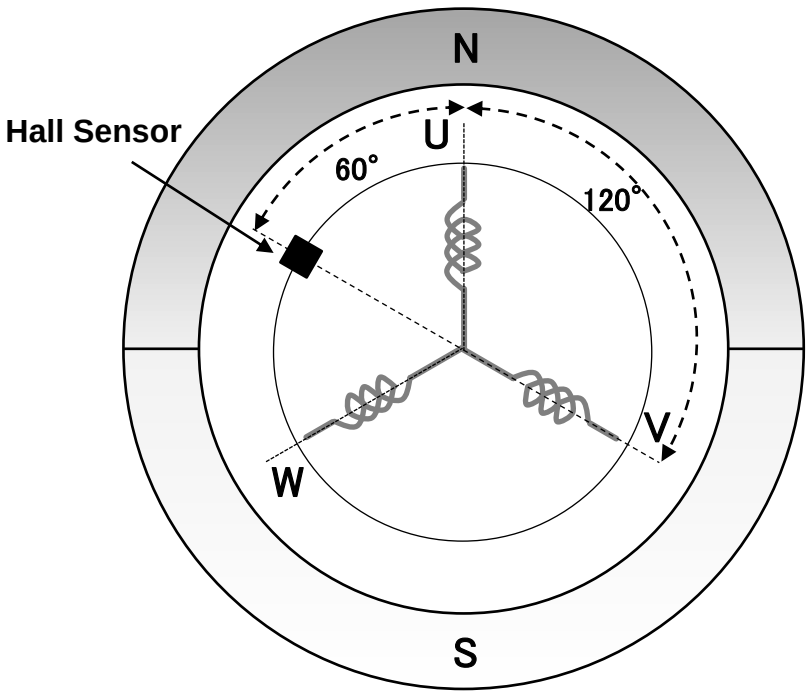
Note) The characteristics listed below are reference values derived from design of the IC and are not guaranteed.

3. Hall Input Specification (Continued)

3-4. Hall Sensor Placement

This IC uses only 1 hall sensor.
Please put Hall sensor at the center between U and W stator coils.

The diagram below shows the hall placement for a 2 pole 3 slots motor



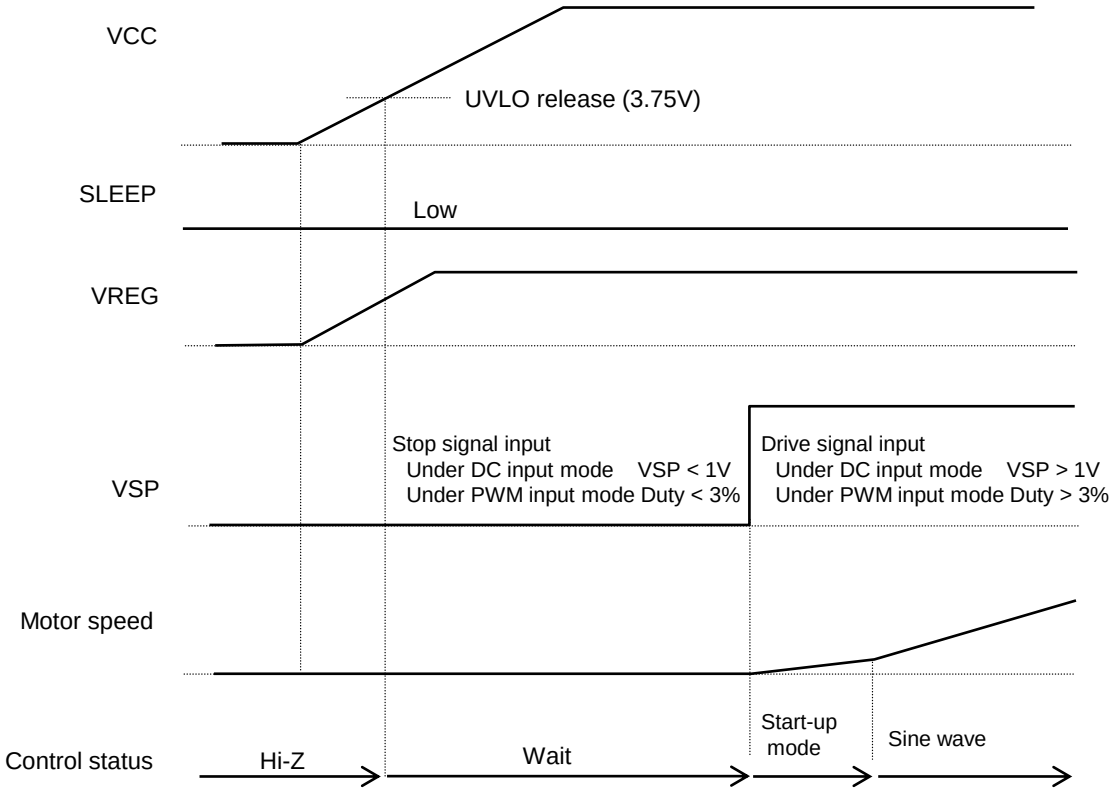
Example placement for the hall sensor
(2 pole 3 slot motor)

OPERATION (Continued)

Note) The characteristics listed below are reference values derived from design of the IC and are not guaranteed.

4. Start / Stop control

Start-up by rising VCC pin voltage



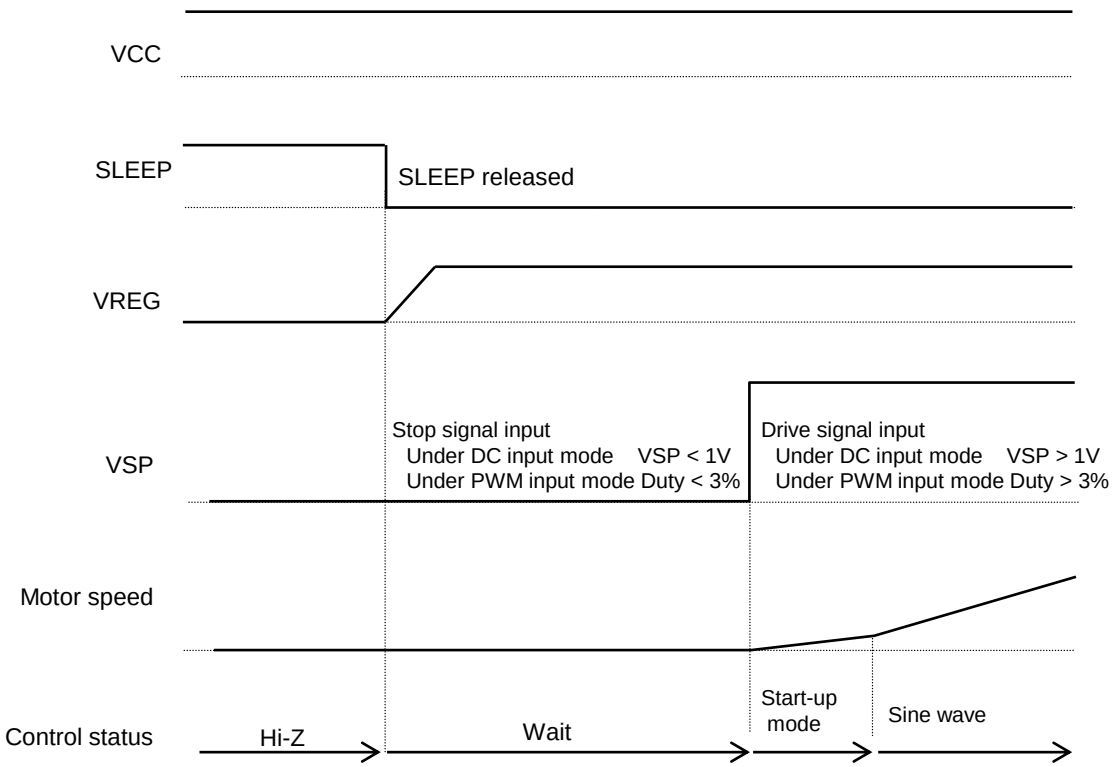
・During start up mode, no FG signal is output.

OPERATION (Continued)

Note) The characteristics listed below are reference values derived from design of the IC and are not guaranteed.

4. Start / Stop control (Continued)

Start-up by SLEEP signal release



・During start up mode, no FG signal is output.

OPERATION (Continued)

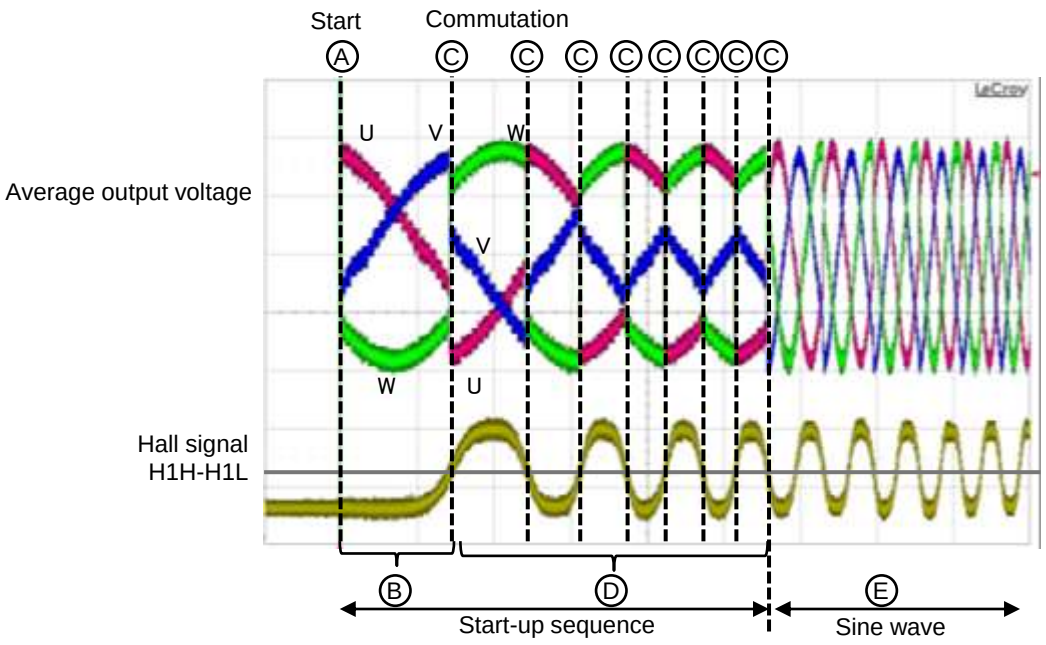
Note) The characteristics listed below are reference values derived from design of the IC and are not guaranteed.

4. Start / Stop control (Continued)

Start-up sequence

The waveform during start up is shown by below figure.

Start-up waveform



(RDS, SFSW) ≠ (L, H) 1.8Hz
(RDS, SFSW) = (L, H) 0.9Hz

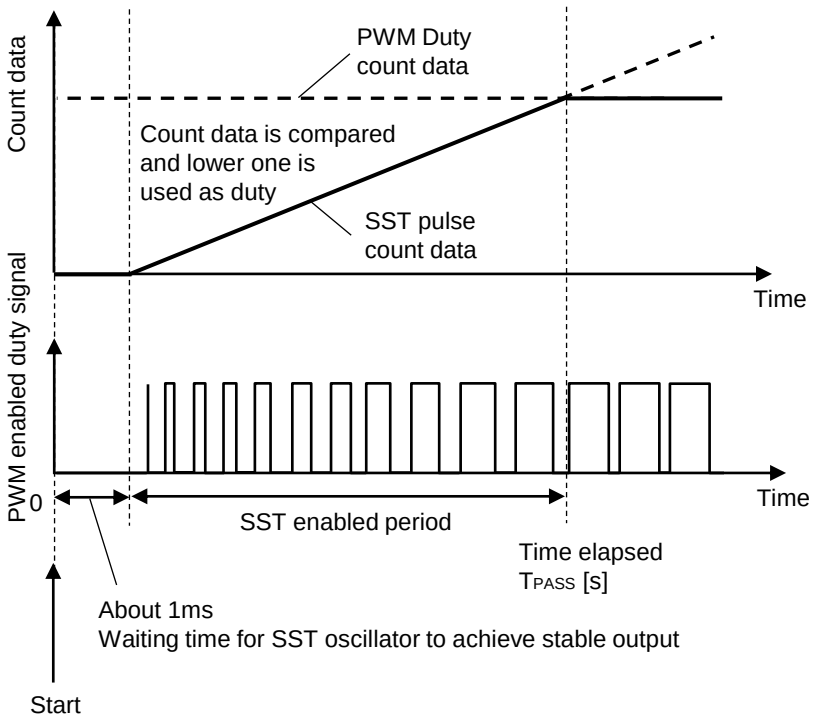
OPERATION (Continued)

Note) The characteristics listed below are reference values derived from design of the IC and are not guaranteed.

5. Soft Start Function and PWM Specification

By connecting a capacitor to the SST pin, soft start control is performed by the start-up mode conditions during the mode transition. The period for soft start control is determined by the formula shown on the next page. When soft start control is not required, ensure to connect SST pin to VREG pin.

Below shows the correlation timing chart of count data and PWM enabled duty for VSP and SST.



・Notes on the use of the soft-start function.
With the increase in soft-start time, the motor current will also increase slowly. Therefore if the soft-start timing is too long, it will result in the motor not having enough starting torque and lock protection detection will be triggered if soft start timing is more than 0.5s (typ). This will cause the motor to be unable to start. Please evaluate and check this condition thoroughly when using this function.

OPERATION (Continued)

Note) The characteristics listed below are reference values derived from design of the IC and are not guaranteed.

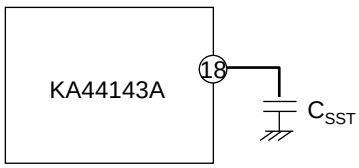
5. Soft Start Function and PWM Specification (Continued)

The triangle wave oscillator frequency output by SST pin is determined by the below formula. Soft Start timing is generated by comparing the VSP pin input PWM frequency and this triangle waveform frequency.

Triangle wave oscillator frequency

$$f_{SST} = \frac{I_{SST}}{2 \times C_{SST} \times V_{SST}}$$

V_{SST} : Triangle waveform amplitude (At typ. 1 V)
I_{SST} : Current flowing in/out SST pin (At typ. 4 μA)



The PWM enabled duty reflected in the output, at the time elapsed T_{PASS} within the SST enabled timing is determined by the below formula:

$$\text{PWM duty} = \frac{T_{PASS} \times T_{OSC}}{T_{SST} \times T_{PWM}}$$

T_{PWM} : Input PWM cycle [s]
T_{OSC} : Oscillation cycle of internal oscillator $40*10^{-9}$ [s]
T_{SST} : SST triangle wave oscillation cycle[s]
T_{PASS} : Time elapsed [s]

T_{PASS} at the end of the SST timing can be determined by the below formula:

$$T_{PASS} = \frac{T_{PWM} \times D \times T_{SST}}{T_{OSC}}$$

D : Input PWM duty [%]

Input PWM duty during the DC input can be determined by the below formula:

$$D = \left(\frac{97}{3} \times V_{VSP} - \frac{88}{3} \right) \times 0.01$$

Under DC input, V_{VSP}=1V～4V

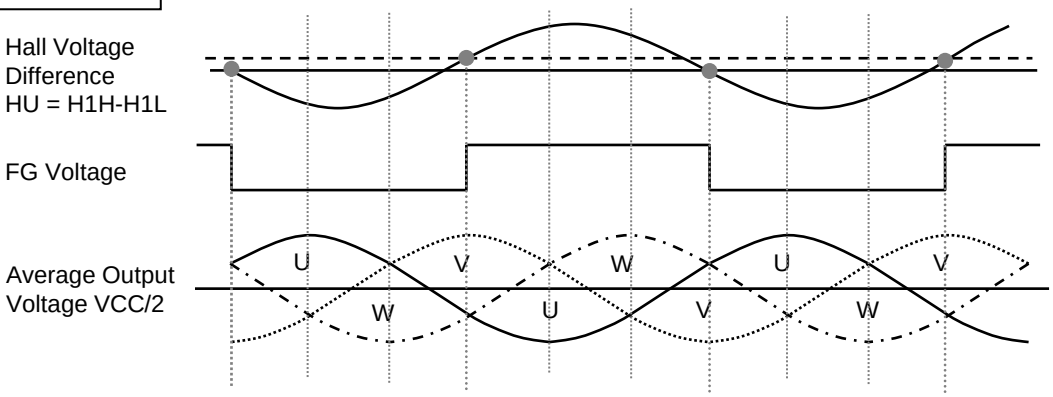
OPERATION (Continued)

Note) The characteristics listed below are reference values derived from design of the IC and are not guaranteed.

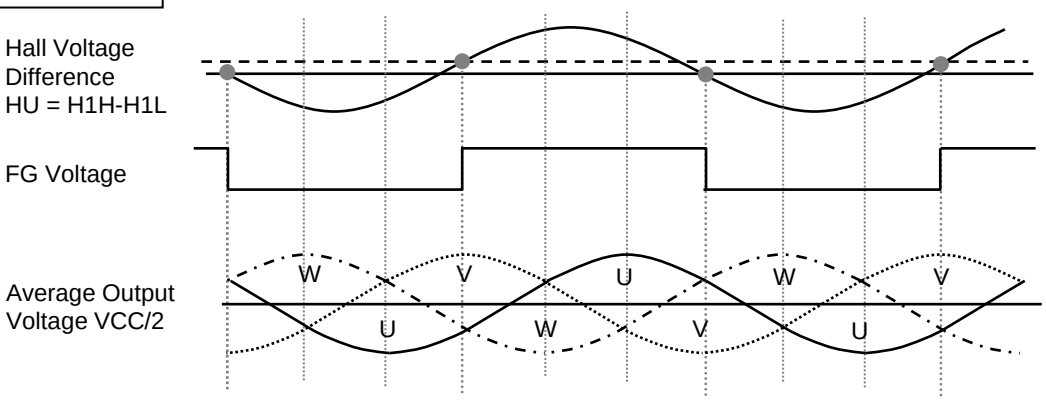
6. Forward, Reverse and Short-brake

The Relation among Hall, FR (Forward/Reverse) and Average Output Voltage

Forward (FR = L)



Reverse (FR = H)



FR switch operation	F/R is not switched instantly. Once motor rotation stops, then run at reverse direction

OPERATION (Continued)

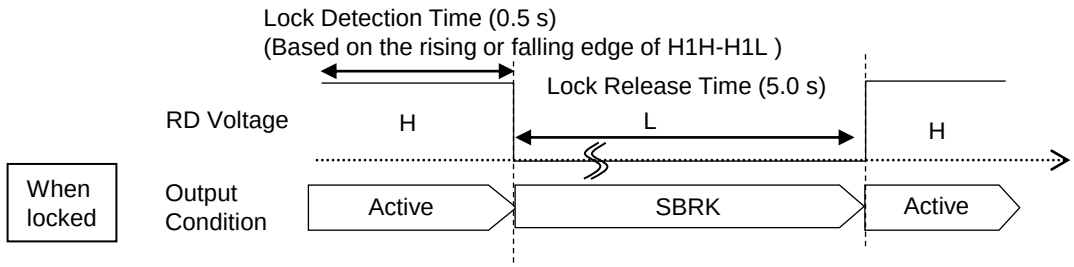
Note) The characteristics listed below are reference values derived from design of the IC and are not guaranteed.

7. Protection Functions

7-1. Motor Lock Protection

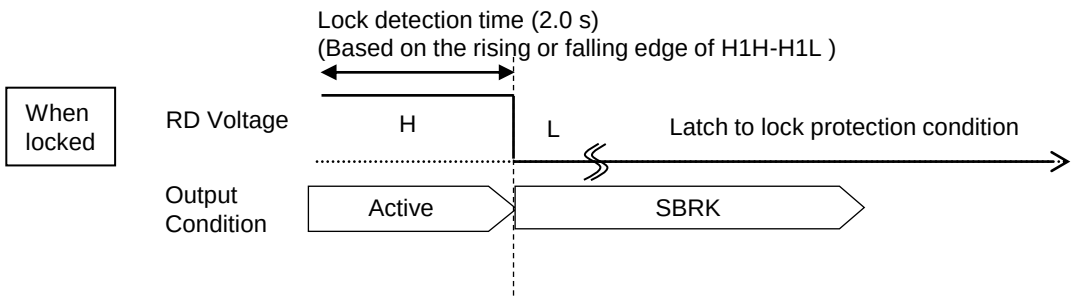
When RDS=L, SFSW=L or H (Automatic reset mode)

When no signal for Hall signal input (Based on the rising or falling edge of H1H-H1L) is continued for 0.5s(SFSW=L) or 1.0s(SFSW=H) or more, motor output turns OFF (short-brake) and Motor Lock Protection starts working (RD = L), and automatically resets after 5s(SFSW=L) or 10s(SFSW=H) elapses. Motor Lock Protection is released immediately by Hall signal input (rising or falling edge of H1H-H1L), VSP signal input, FR signal switched, UVLO signal input and SLEEP signal input.



When RDS=H, SFSW=L (Latch mode)

When there is no hall signal (Based on the rising or falling edge of H1H-H1L) for more than 2.0s, motor output will be OFF (Short-brake), operation will switch and latch to RD=L protection. UVLO signal input and SLEEP signal input will immediately release the protection.



OPERATION (Continued)

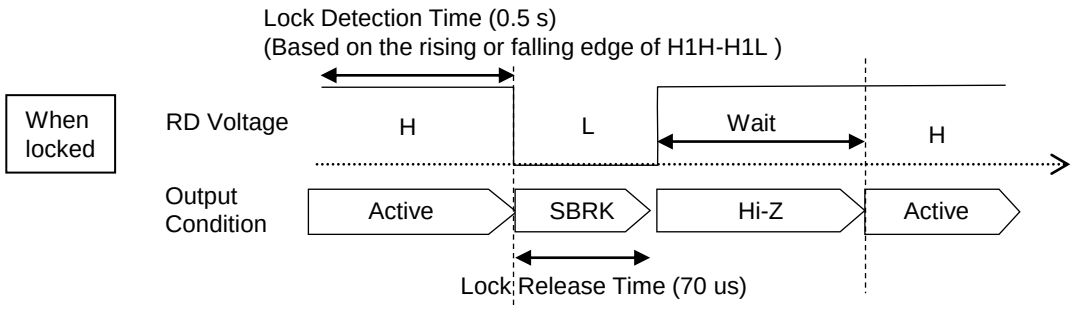
Note) The characteristics listed below are reference values derived from design of the IC and are not guaranteed.

7. Protection Functions

7-1. Motor Lock Protection (Continued)

When RDS=H, SFSW=H (Immediately reset mode)

When no signal for Hall signal input (Based on the rising or falling edge of H1H-H1L) is continued for 0.5s or more, Motor Lock Protection immediately resets(after 70us elapses). Motor Lock Protection is released immediately by Hall signal input (rising or falling edge of H1H-H1L), VSP signal input, FR signal switched, UVLO signal input and SLEEP signal input.



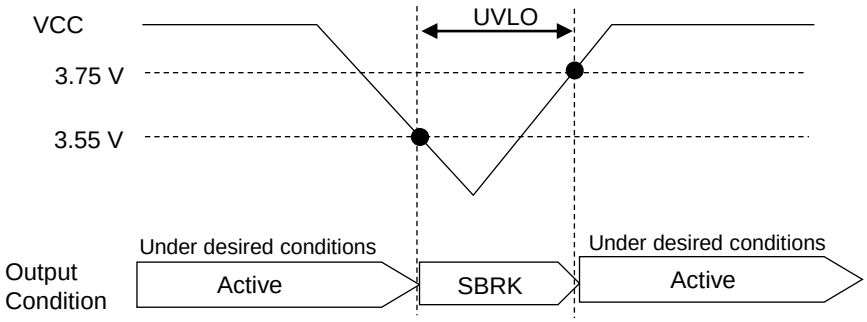
OPERATION (Continued)

Note) The characteristics listed below are reference values derived from design of the IC and are not guaranteed.

7. Protection Functions

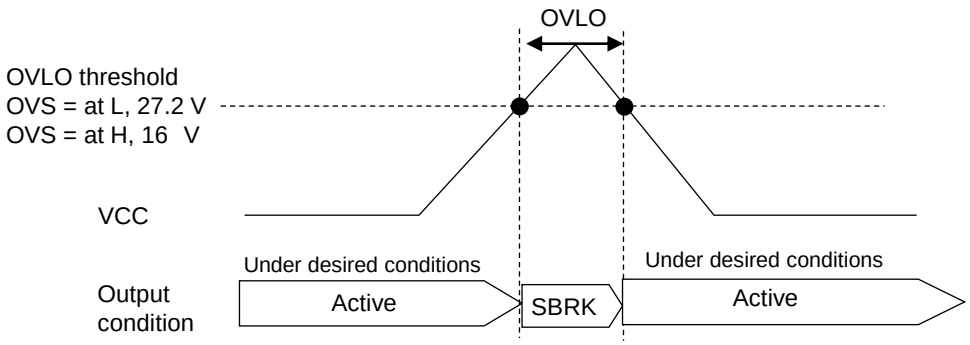
7-2. Under Voltage Lock Out (UVLO)

When VCC voltage drops to 3.55V and below, UVLO activates and motor output enters short-brake mode.
When VCC voltage increases to 3.75V and above, UVLO is released.



7-3. Over Voltage Lock Out (OVLO)

When VCC voltage increases above threshold, OVLO activates and motor output enters short-brake mode.
When VCC voltage drops below threshold, OVLO is released.



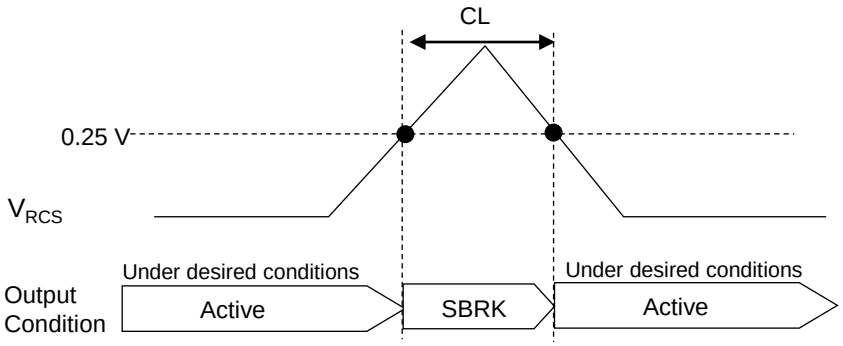
OPERATION (Continued)

Note) The characteristics listed below are reference values derived from design of the IC and are not guaranteed.

7. Protection Functions

7-4. Over Current Protection (CL)

When RCS voltage increases to 0.25 V and above, OCP starts working and motor output enters short-brake mode.
When RCS voltage decreases to 0.25 V and below, OCP is released.



Current value for over current detection can be set by varying the RCS pin detection resistor (RCS).

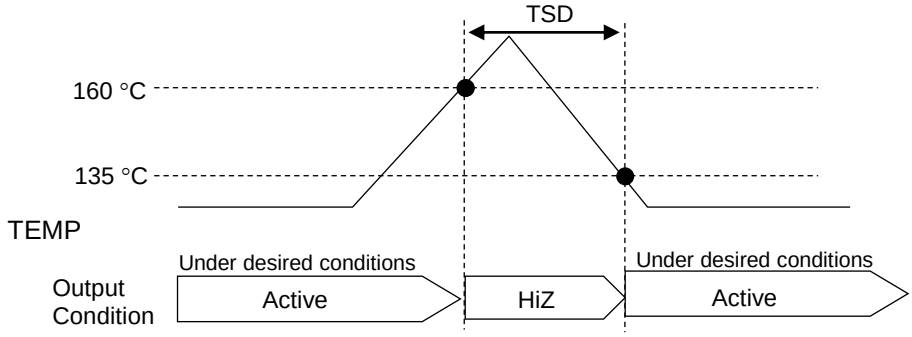
Over current protection current detection value $I_{PEAK} = 0.250V \times \frac{1}{RCS}$

Eg: I_{PEAK} = To set to 1.0 A, set RCS to 0.250 Ω based on the below formula.

$$RCS = 0.250(V) \times \frac{1}{1.00(\mathrm{A})} = 0.250(\Omega)$$

7-5. Thermal Shut Down (TSD)

When IC junction temperature increases to 160℃ and above, TSD activates and motor output turns OFF.
When IC junction temperature drops to 135℃ and below, TSD is released.



OPERATION (Continued)

Note) The characteristics listed below are reference values derived from design of the IC and are not guaranteed.

8. Control mode Table

Pin No.	Pin Name	Description	Voltage		Remarks
			Open（Low）	High	
3	SLEEP	Sleep mode select	Normal	Sleep	SLEEP = “H” : Sleep mode (Motor energization: OFF, VREG output: OFF) SLEEP = “L” : Normal mode Note) For the setting range of SLEEP control voltage, refer to “SLEEP” under Electrical Characteristics on page 7.
14	OVS	OVP Threshold select	27.2V	16V	Note: Please connect to VREG pin when set to High.
16	PS	Phase Shift mode select	Auto	Constant	Note: Please connect to VREG pin when set to High. Note: Do not switch during motor driving.
18	SST	Capacitor connection pin for Soft Start triangle wave oscillator frequency setting	-	Soft start control not in use	When soft start control is not in used, please connect SST pin to VREG pin. When soft start control is in used, please connect a capacitor to SST pin.
19	TRI	Capacitor connection pin for PWM triangle wave oscillator frequency setting	-	PWM input control	When PWM input is used in speed control, please connect TRI pin to VREG pin. When DC input is used in speed control, please connect a capacitor to TRI pin.

Pin No.	Pin Name	Description	Voltage			Remarks
			Low	Open（Middle）	High	
22	FR	Rotation direction select (Forward/Reverse) Short-brake control input	Forward	Short-brake	Reverse	Arbitrary direction is denoted as “Forward”, and reverse direction is denoted as “Reverse”. Note) For the setting range of FR control voltage, refer to “FR” under Electrical Characteristics on page 9.
17	FGSEL	FG pulse count select [ratio of hall signal cycle]	1/3	1/2	1	FG pulse output which is equivalent to arbitrary magnification of hall signal cycle Note) For set range of FGSEL control voltage, refer to “FGSEL” of the Electrical Characteristics on page 9

Pin No 15 Pin Name RDS	Pin No 23 Pin Name SFSW	Start Frequncy [Hz]	Lock Detection Time [s]	Lock Release Time [s]	Auto reset	Remarks
Low	Low	1.8	0.5	5	YES	The Start frequency, the lock detection and the release time are selectable by RDS and SFSW pin voltage. RDS =“H”, SFSW = “L”：In this pattern, the lock protection isn’t released automatically. The protection is released by UVLO signal input and SLEEP signal input. Note: Please connect to VREG pin when set to High.
Low	High	0.9	1.0	10	YES	
High	Low	1.8	2.0	-	NO	
High	High	1.8	0.5	70µ	YES	

PIN EQUIVALENT CIRCUIT

Note) The characteristics listed below are reference values based on the IC design and are not guaranteed values.

Pin No.	Internal Circuit	Impedance	Description
1, 2		—	Pin1 (RD), Motor lock protection output signal pin. Pin2 (FG), FG output signal pin.
3		100kΩ	Pin3(SLEEP), Sleep select input pin.

PIN EQUIVALENT CIRCUIT (continued)

Note) The characteristics listed below are reference values based on the IC design and are not guaranteed values.

Pin No.	Internal Circuit	Impedance	Description
4		—	Pin4 (VREG) Internal voltage regulator.
6, 12		—	Pin6(VPUMP), Charge pump output pin. Pin12(BC2) , Pin to connect the boost capacitor.

PIN EQUIVALENT CIRCUIT (continued)

Note) The characteristics listed below are reference values based on the IC design and are not guaranteed values.

Pin No.	Internal Circuit	Impedance	Description
8, 9, 10, 11		—	Pin8 (W), 10 (V), 11 (U), Output channel pins to be connected to the motor Pin9（RCS), Motor current sense resistor pin.

PIN EQUIVALENT CIRCUIT (continued)

Note) The characteristics listed below are reference values based on the IC design and are not guaranteed values.

Pin No.	Internal Circuit	Impedance	Description
13		—	Pin13 (BC1), Pin to connect the boost capacitor.
14		1000kΩ	Pin14(OVS), Over voltage protection threshold selection pin.

PIN EQUIVALENT CIRCUIT (continued)

Note) The characteristics listed below are reference values based on the IC design and are not guaranteed values.

Pin No.	Internal Circuit	Impedance	Description
15, 16		1000kΩ	Pin15 (RDS), Motor lock protection input control pin. Pin16(PS) , Auto phase control setting input control pin. ・Connect pin to VREG voltage when there is a need to set to high level.
17		—	Pin17(FGSEL), FG signal input control pin. ・Connect pin to VREG voltage when there is a need to set to high level. ・When pin is used in open condition, please connect capacitor to pin to prevent noise from affecting operation. Please do verifications and evaluation for this condition.
18		—	Pin18 (SST), Soft start triangle waveform using external capacitor to set the frequency. ・Connect pin to VREG voltage when SST is not in used.

PIN EQUIVALENT CIRCUIT (continued)

Note) The characteristics listed below are reference values based on the IC design and are not guaranteed values.

Pin No.	Internal Circuit	Impedance	Description
19		—	Pin19 (TRI), Connect a capacitor to TRI pin to set the frequency in DC input mode. ・Connect pin to VREG voltage in PWM mode.
20, 21		—	Pin20 (H1H) , Hall amplifier + input terminal. Pin21(H1L) , Hall amplifier - input terminal.

PIN EQUIVALENT CIRCUIT (continued)

Note) The characteristics listed below are reference values based on the IC design and are not guaranteed values.

Pin No.	Internal Circuit	Impedance	Description
22		—	Pin22 (FR), Forward / reverse rotation and short brake control input pin.
23		—	Pin23 (SFSW), Start frequency selection pin.
24		330kΩ	Pin24 (VSP), Input pin for speed required ・In PWM input mode, please use the high and low level as required in the specifications.

USAGE NOTES

- Below are the notes to take note when using this IC.

1. Pay attention to the direction of the IC. When mounting it in the wrong direction onto the PCB (printed-circuit-board), it might be damaged.
2. Pay attention in the PCB (printed-circuit-board) pattern layout in order to prevent damage due to short circuit between pins. In addition, refer to the Pin Description for the pin configuration.
3. Perform visual inspection on the PCB before applying power, otherwise damage might happen due to problems such as solder-bridge between the pins of the IC. Also, perform full technical verification on the assembly quality, because the same damage possibly can happen due to conductive substances, such as solder ball, that adhere to the IC during transportation.
4. Take notice in the use of this IC that it might be damaged when an abnormal state occurs such as output pin-VCC short (Power supply fault), output pin-GND short (Ground fault), or output-to-output-pin short (load short). Safety measures such as installation of fuses are recommended because the extent of the above-mentioned damage will depend on the current capability of the power supply.

   Although the following pins comes with short circuit protection function, the protection may be damaged depending on the VCC voltage. Pins with short circuit protection function: Pin11(U), Pin10(V) and Pin8(W).
5. The protection circuit is for maintaining safety against abnormal operation.

   When sudden voltage or current change is applied to the pin, it may exceed the designated voltage and current level and therefore, customer shall perform sufficient evaluation and verification to ensure these are not exceeded in the usage.

   Especially for the thermal protection circuit, if the area of safe operation or the absolute maximum rating is momentarily exceeded due to output pin to VCC short (Power supply fault), or output pin to GND short (Ground fault), the IC might be damaged before the thermal protection circuit could operate.
6. Unless specified in the product specifications, make sure that negative voltage or excessive voltage are not applied to the pins because the IC might be damaged, which could happen due to negative voltage or excessive voltage generated during the ON and OFF timing when the inductive load of a motor coil or actuator coils of optical pick-up is being driven.
7. Product which has specified ASO (Area of Safe Operation) should be operated in ASO
8. Verify the risks which might be caused by the malfunctions of external components.
9. Comply with the instructions for use in order to prevent breakdown and characteristics change due to external factors (ESD, EOS, thermal stress and mechanical stress) at the time of handling, mounting or at customer's process
10. Dip soldering is not recommended.
11. Connect the metallic plate (fin) on the back side of the IC to the GND potential. The thermal resistance and electrical characteristics are guaranteed only when the metallic plate (fin) is connected with the GND potential.
12. Follow the power supply voltage, load and ambient temperature conditions to ensure that there is enough margin and the thermal design does not exceed the allowable value.
13. When designing your equipment, comply with the range of absolute maximum rating and the guaranteed operating conditions (operating power supply voltage and operating environment, etc.). Especially, please be careful not to exceed the range of absolute maximum rating on the transient state, such as power-on, power-off and mode switching. Otherwise, we will not be liable for any defect which may arise later in your equipment.

    Even when the products are used within the guaranteed values, take into the consideration of incidence of break down and failure mode, possible to occur to semiconductor products. Measures on the systems such as redundant design, arresting the spread of fire or preventing glitch are recommended in order to prevent physical injury, fire, social damage, for example, by using the products.

USAGE NOTES (Continued)

- Below are the notes to take note when using this IC. (Continued)

14. Apply power supply with low impedance to VCC and connect bypass capacitor near to the IC.
15. When designing PCB pattern for RCS pin (Pin 9), place a resistor for current detection (R_{RCS}) close to the IC. The setting value for over current protection may fluctuate due to the impedance of wiring pattern between RCS pin and the RCS resistor.
16. When VCC is input, VCC voltage will start to rise to the designated voltage. However, at the same time, motor driver starts driving and when this results in decreases the VCC voltage, it may disrupt the normal start-up. Therefore, please conduct sufficient evaluation and verification to ensure the power supply current.
17. The minimum input amplitude of hall signal comparator should be designed in consideration of tolerances and temperature characteristics of the hall element, so that it will not result in failure to the motor operation.
18. In the 1-HALL-sensor system motor driver adopted in this IC, energization pattern of a cycle is generated based on previous 1-cycle of a HALL input signal. Therefore, when the acceleration of a motor is very high, the motor may be unable to accelerate normally because of the big difference in cycle between the generated energization pattern and the motor rotation. When using a motor with very high speed acceleration, ensure to conduct sufficient technical evaluation and examination on the sudden acceleration from low rotation.

    When the above acceleration problems arises, the problem may be improved by putting the speed to zero first and then input the required speed. Please conduct sufficient evaluation before use.

    (When HALL input signal of below 10Hz is inputted to this IC, putting the speed to zero and then input the required speed again will restart the rotation.)
19. Do not change the control signal of SLEEP pin (pin 3) from Low to High while motor is running at high speed. The IC can be damaged due to the effect of induced voltage and conduction angle. Conduct sufficient technical evaluation to verify.
20. Brake current during short brake is determined by the motor running speed and motor characteristics.
    Before the short brake, please review and evaluate by reducing the motor current and lower the motor speed.
    Please refer to the ASO data and perform sufficient evaluation to ensure that the IC is not damaged.
21. In case the motor running speed changes from high to low rapidly, supply voltage can be increased due to the flow back of motor current. Conduct sufficient evaluation and examination to ensure there is no issue.
22. When designing PCB pattern, place a resistor for current detection (RCS) close to the IC. The setting value for over current protection may fluctuate due to the impedance of wiring pattern between RCS pin and the RCS resistor.
23. FG pin (Pin 1) and RD pin (Pin 2) are open-drain outputs. Connect a pull-up resistor to the designated power supplies and use this IC within the allowable voltage and current ranges.
24. For the below pins, please ensure to connect to VREG pin under High level condition.
    TRI pin (Under PWM control), SST pin (When Soft Start not used), FGSEL pin, PS pin, RDS pin, OVS pin and SFSW pin.
    In addition, these terminals, changing the applied voltage during the operation of this product, we do not assume.
    When changing the voltage applied to the terminal settings, please temporarily turn off the power.
25. When connecting TRI pin to VREG pin using PWM input mode, please make sure to input High level or Low level to the VSP pin. Other voltage levels between High and Low level may result in unexpected operation.
26. Due to the initial position of the rotor, the starting torque differs slightly during start-up. For motor type that requires large inertia force to turn, please ensure that sufficient starting current is available for the motor. Please perform sufficient testing and evaluations to ensure this.
27. If the soft-start timing is too long, it will result in the motor not having enough starting torque and lock protection detection will be triggered if soft start timing is more than 0.5s (typ). This will cause the motor to be unable to start. Please evaluate and check this condition thoroughly when using this function.
28. Sufficiently check the characteristics before use. When there is changes in the external circuits, please check both static and transient characteristics and ensure that there is enough margin.

USAGE NOTES (Continued)

- Below are the notes to take note when using this IC. (Continued)

29. When input power to VCC(Pin7), it is recommended that VCC voltage rises slower than 1.5V/μs and when turn off, VCC voltage drops slower than -1.5V/μs.
    When performing power up and shutdown at high-speed, please ensure sufficient evaluation is performed to verify that there is no problem.

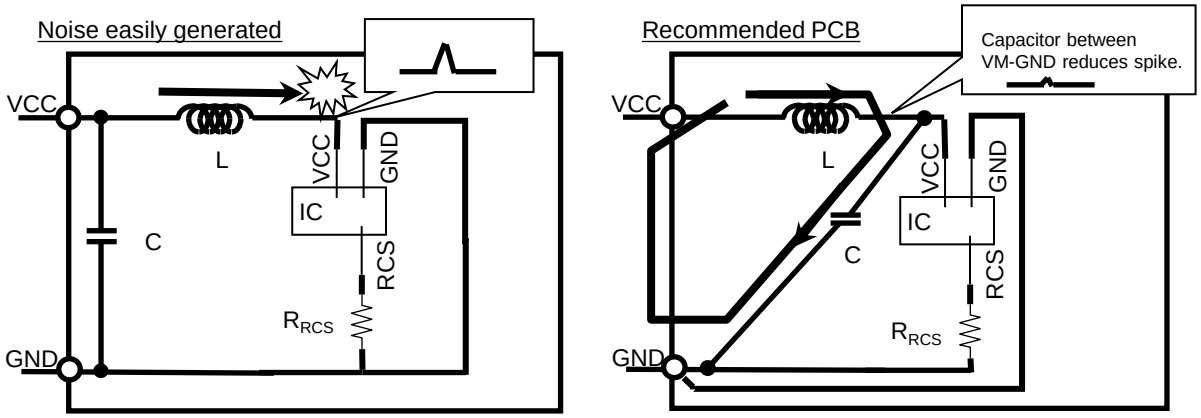
30. Capacitor between VCC and GND
    This IC employs the PWM driving method and hence, output transistor switches under high current condition and this easily generates noise. Therefore the IC may be damaged or malfunction due to noise.
    Hence, it is necessary to ensure that the power supply is stable so as to avoid circuit damaged or malfunction due to noise.
    Where possible, place a capacitor between VCC and GND near to the IC so that IC will not malfunction due to PWM noise and gets damaged.

31. Points to note for Motor PCB pattern
    As this IC is used under high current, it is necessary to take note of common impedance in the pattern.
    Please take care of the following in the pattern design of the motor PCB.

- As high current flows from VCC connector to the IC VCC pin (Pin7) and through the metal lines, if the metal line is a 'L' shape pattern, noise may be easily generated resulting in malfunction and damage during switching (Bottom left figure).
  From the figure on the right, if a capacitor is placed with respect to the connector near VCC, a noise discharge route is created and this reduces the VCC voltage directly to the IC pin. Where possible, please follow the figure on the right.
  In addition, metal line impedance depends on the pattern length and therefore, please keep the metal line between VCC connector and IC VCC pin as short and as thick as possible in the design.

- The line between current detection resistor (R_{RCS}) to RCS pin (Pin9) is very important. Therefore, where possible, it is recommended to use an isolated line to connect from the start of the detection resistor to the RCS pin.
  Accurate current value may not be detected due to metal impedance if R_{RCS} is placed far from the IC. Therefore, if it is not possible to place near to the IC, please ensure that the motor current waveform and R_{RCS} current waveform is accurate.

- Please ensure that the line between the GND connector and RCS resistor is isolated from the IC GND pin (Pin5).
  If a common line is used, it may result in malfunction or IC ground connection voltage unstable due to line impedance.
  In addition, to reduce line impedance effect, please ensure that GND line is as short and as thick as possible in the design.



USAGE NOTES (Continued)

- Below are the notes to take note when using this IC. (Continued)

32. This IC has five protecting functions. Pay attention to the descriptions below.

Function	Operate/Release	Conditions	Remarks
Under voltage lock out (UVLO)	• Operate VCC ≤ 3.55 V • Release VCC ≥ 3.75 V	(Short brake) Upper-phase: OFF Lower-phase: ON	Large current may be generated due to a short brake during motor rotation. Conduct sufficient verification to prevent damages.
Over voltage lock out (OVLO)	• Operate/Release VCC input voltage1: 16.0V (typ.) VCC input voltage2: 27.2V (typ.)	(Short brake) Upper-phase: OFF Lower-phase: ON	Large current may be generated due to a short brake during motor rotation. Conduct sufficient verification to prevent damages.
Over Current Protection (CL)	• Operate: RCSS voltage ≥ 0.25V (typ.) • Release: RCSS voltage ≤ 0.25V (typ.)	(Short brake) Upper-phase: OFF Lower-phase: ON	R_{RCS} is a current detection resistor. Concerning level of detection, false detection may occur due to the effect of PCB layout or noise. In addition, when specifying the resistance value of R_{RCS}, take the followings into consideration: Level of detection, tolerance in resistance value of R_{RCS}, temperature, ratings, etc.
Motor Lock Protection	• Operate: Hall signal input cycle ≥ 0.5 s (RDS=L, SFSW=L) (RDS=H, SFSW=H) ≥ 1.0 s (RDS=L, SFSW=H) ≥ 2.0 s (RDS=H, SFSW=L) (Based on the rising or falling edge of H1H-H1L) • Release: • With RDS and SFSW is set to following voltage,any of the below 7 conditions will result in the protection to release. ・RDS = L or open and SFSW = L or H ・RDS = H and SFSW = H ①SLEEP is input with 'H' ②UVLO operates (VCC<3.55V) ③Automatic reset after the following time; 5 s (RDS=L, SFSW=L) 10 s (RDS=L, SFSW=H) 70 us (RDS=H,SFSW=H) ④Hall signal being input (Rising or falling edge of H1H-H1L) ⑤VSP(PWM)<3.0%(typ), or VSP(DC)<1.0V(typ) is inputted ⑥FR signal switch is inputted ⑦SBRK signal is inputted • Control restrictions to protection functions When RDS is set to 'H' and SFSW is set to 'L', the above ③～⑦ will be disabled.	(Short brake) Upper-phase: OFF Lower-phase: ON	Brake current may be generated due to protection circuit operating during the motor rotation. Conduct sufficient verification to prevent damages.
Thermal Protection	・ Operate: IC junction temperature > 160℃ ・ Release: IC junction temperature < 135℃	All phases: OFF	Since all phases are OFF when protecting function operates, reverse current may be generated due to the repetition ON-OFF switching of the protection function during motor rotation. Pay attention to the voltage rise.

Important Notice

Nuvoton Products are neither intended nor warranted for usage in systems or equipment, any malfunction or failure of which may cause loss of human life, bodily injury or severe property damage. Such applications are deemed, "Insecure Usage".

Insecure usage includes, but is not limited to: equipment for surgical implementation, atomic energy control instruments, airplane or spaceship instruments, the control or operation of dynamic, brake or safety systems designed for vehicular use, traffic signal instruments, all types of safety devices, and other applications intended to support or sustain life.

All Insecure Usage shall be made at customer's risk, and in the event that third parties lay claims to Nuvoton as a result of customer's Insecure Usage, customer shall indemnify the damages and liabilities thus incurred by Nuvoton.
